

WHAT IS CLAIMED IS:

1. A test method of internal connections between a first integrated circuit and a second integrated circuit, both of which are housed in a semiconductor package and connected with each other, comprising:

- 5 applying a test signal to a first pin of the semiconductor package;
 applying the test signal from the first pin to the first integrated circuit;
 applying a first signal generated in the first integrated circuit from the test signal to
the second integrated circuit;
 applying a second signal generated in the second integrated circuit from the first
10 signal to the first integrated circuit;
 outputting a third signal generated in the first integrated circuit from the second
signal to a second pin of the semiconductor package; and
 verifying the third signal outputted to the second pin of the semiconductor package.

- 15 2. The test method of claim 1, wherein the first integrated circuit comprises a
TV signal processing IC which demodulates a TV signal.

3. The test method of claim 2, wherein the second integrated circuit comprises a
microcomputer which has a function to decode a signal from the TV signal processing IC.

20

4. The test method of claim 3, wherein the test signal comprises a closed caption
signal.

5. The test method of claim 4, wherein the signal outputted to the second pin
25 comprises one of three primary color signals selected by a switch provided in the first
integrated circuit between three primary color signals to display a normal picture and
three primary color signals to display a subtitle.

6. The test method of claim 3, wherein the test signal comprises a video signal
30 comprising a closed caption signal.
